

## CLAIMS

1. A method for debugging of analog and mixed-signal behavioral models in simulation, said method comprising the steps of:

- 5        performing a regular iterative equation solution process; and
- performing a replay of the last iteration of an accepted timepoint;
- wherein a user only gets to interact with the simulation during said iteration replay.

10    2. A method for debugging of analog and mixed-signal behavioral models in simulation, said method comprising the steps of:

- performing a standard transient analysis algorithm, wherein Newton-Raphson iteration is generally followed; and
- performing a replay of the last Newton-Raphson iteration of an
- 15    accepted timepoint;
- wherein a user is allowed to interact with the simulation during said replay only.

3. The method of Claim 2, wherein the user may interactively debug a

20    behavioral model by single stepping through the simulation.

4. The method of Claim 2, wherein the user may interactively debug a behavioral model when a statement breakpoint is triggered in the simulation.

5. The method of Claim 2, wherein the user may interactively debug a behavioral model when an object value change breakpoint is triggered in the simulation.

6. The method of Claim 2, wherein the user may interactively debug a behavioral model when a write access breakpoint is triggered in the simulation.

7. A method for debugging of signal behavioral models, comprising the steps of:

- (1) setting a trial time to start a transient analysis algorithm;
- (2) initializing Newton-Raphson iteration;
- (3) linearizing about the previous iteration;
- (4) choosing model instance;
- (5) choosing sequential statement;
- (6) executing said sequential statement;
- (7) testing whether said sequential statement is the last statement;

(8) switching to a next statement and going to step (6) if the result of step (7) is false;

(9) adding contributions to matrix A and vector b of a matrix equation  $Ax=b$  if the result of step (7) is true;

5 (10) testing whether said model is the last model;

(11) switching to a next model and going to step (5) if the result of step (10) is false;

(12) solving said matrix equation  $Ax=b$  if the result of step (10) is true;

10 (13) testing whether the solution of said matrix equation  $Ax=b$  converges;

(14) moving to a next iteration and going to step (3) if the result of step (13) is false;

(15) testing whether the trial timepoint is acceptable if the result of step (13) is true;

15 (16) rejecting said trial timepoint, choosing an alternate timepoint, and moving to step (2) if the result of step (15) is false;

(17) testing whether debugging is needed if the trial timepoint is accepted at step (15);

(18) testing whether said alternate timepoint is the last time point if the  
20 result of step (17) is false;

(19) moving to a next timepoint and moving to step (2) if the result of step (18) is false; and

(20) finishing said algorithm if the result of step (18) is true; and

wherein the last Newton-Raphson iteration of said accepted timepoint

5 is replayed if the result of step (17) is true; and

wherein said replay of the last Newton-Raphson iteration comprises the steps of:

(21) choosing model instance;

(22) choosing sequential statement;

10 (23) testing whether the user is debugging by single stepping through the simulation or a statement breakpoint is encountered at said sequential statement;

(24) going interactive and then moving to step (25) if the result of step (23) is true;

15 (25) executing said sequential statement if the result of step (23) is false or preceded by step (24);

(26) testing whether a value change breakpoint or a write access breakpoint has occurred on an object of interest to the user;

(27) going interactive and then moving to step (28) if the result of step (26) is true;

(28) testing whether said sequential statement is the last statement if the result of step (26) is false or preceded by step (27);

5 (29) moving to a next statement and moving to step (23) if the result of step (28) is false;

(30) testing whether said model is the last model;

(31) moving to a next model and moving to step (22) if the result of step (30) is false;

10 (32) moving to step (18) if the result of step (30) is true.

8. The method of Claim 7 is implemented on a simulator for solving systems of non-linear equations which can be represented by behavioral models.

15 9. The method of Claim 7 is implemented on an analog circuit simulator.

10. The method of Claim 7 is implemented on a mixed-signal simulator which comprises at least one digital simulation engine and at least one analog simulation engine.

11. The method of Claim 7 is implemented on a partitioned and multi-rated analog circuit simulator.

12. The method of Claim 7 is implemented on a mixed-signal simulator which comprises at least one digital simulation engine and at least one partitioned and multi-rated analog simulation engine.

13. A computer usable medium containing instructions in computer readable form for carrying out a process for debugging of signal behavioral models in simulation, wherein said process comprises the steps of:

performing a regular iterative equation solution process; and

performing a replay of the last iteration of an accepted timepoint;

wherein a user only gets to interact with the simulation during said iteration replay.

14. A computer usable medium containing instructions in computer readable form for carrying out a process for debugging of analog and mixed-signal behavioral models in simulation, wherein said process comprises the steps of:

performing a standard transient analysis algorithm, wherein Newton-

Raphson iteration is generally followed; and

performing a replay of the last Newton-Raphson iteration of an  
accepted timepoint;

wherein a user is allowed to interact with the simulation during said  
replay only.

5

15. The computer usable medium of Claim 14, wherein the user may  
interactively debug a behavioral model by single stepping through the  
simulation.

10 16. The computer usable medium of Claim 14, wherein the user may  
interactively debug a behavioral model when a statement breakpoint is  
triggered in the simulation.

15 17. The computer usable medium of Claim 14, wherein the user may  
interactively debug a behavioral model when an object value change  
breakpoint is triggered in the simulation.

18. The computer usable medium of Claim 14, wherein the user may  
interactively debug a behavioral model when a write access breakpoint is  
20 triggered in the simulation.

19. The computer usable medium of Claim 14, wherein said instructions in a computer readable form may be downloaded from a website over the Internet.

20. A computer usable medium containing instructions in computer readable form for carrying out a process for debugging of signal behavioral models, wherein said process comprises the steps of:

- (1) setting a trial time to start a transient analysis algorithm;
- (2) initializing Newton-Raphson iteration;
- (3) linearizing about the previous iteration;
- 10 (4) choosing model instance;
- (5) choosing sequential statement;
- (6) executing said sequential statement;
- (7) testing whether said sequential statement is the last statement;
- (8) switching to a next statement and going to step (6) if the result of
- 15 step (7) is false;
- (9) adding contributions to matrix A and vector b of a matrix equation  $Ax=b$  if the result of step (7) is true;
- (10) testing whether said model is the last model;

(11) switching to a next model and going to step (5) if the result of step (10) is false;

(12) solving said matrix equation  $Ax=b$  if the result of step (10) is true;

(13) testing whether the solution of said matrix equation  $Ax=b$  converges;

(14) moving to a next iteration and going to step (3) if the result of step (13) is false;

(15) testing whether the trial timepoint is acceptable if the result of step (13) is true;

(16) rejecting said trial timepoint, choosing an alternate timepoint, and moving to step (2) if the result of step (15) is false;

(17) testing whether debugging is needed if the trial timepoint is accepted at step (15);

(18) testing whether said alternate timepoint is the last time point if the result of step (17) is false;

(19) moving to a next timepoint and moving to step (2) if the result of step (18) is false; and

(20) finishing said algorithm if the result of step (18) is true; and

wherein the last Newton-Raphson iteration of said accepted timepoint is replayed if the result of step (17) is true; and

wherein said replay of the last Newton-Raphson iteration comprises the steps of:

- (21) choosing model instance;
- (22) choosing sequential statement;
- 5       (23) testing whether the user is debugging by single stepping through the simulation or a statement breakpoint is encountered at said sequential statement;
- (24) going interactive and then moving to step (25) if the result of step (23) is true;
- 10       (25) executing said sequential statement if the result of step (23) is false or preceded by step (24);
- (26) testing whether a value change breakpoint or a write access breakpoint has occurred on an object of interest to the user;
- (27) going interactive and then moving to step (28) if the result of step (26) is true;
- 15       (28) testing whether said sequential statement is the last statement if the result of step (26) is false or preceded by step (27);
- (29) moving to a next statement and moving to step (23) if the result of step (28) is false;

(30) testing whether said model is the last model;

(31) moving to a next model and moving to step (22) if the result of step (30) is false;

(32) moving to step (18) if the result of step (30) is true.

5

21. The computer usable medium of Claim 20, wherein said process is implemented on a simulator for solving systems of non-linear equations which can be represented by behavioral models.

10 22. The computer usable medium of Claim 20, wherein said process is implemented on an analog circuit simulator.

23. The computer usable medium of Claim 20, wherein said process is implemented on a mixed-signal simulator which comprises at least one digital  
15 simulation engine and at least one analog simulation engine.

24. The computer usable medium of Claim 20, wherein said process is implemented on a partitioned and multi-rated analog circuit simulator.

25. The computer usable medium of Claim 20, wherein said process is implemented on a mixed-signal simulator which comprises at least one digital simulation engine and at least one partitioned and multi-rated analog simulation engine.

5

26. The computer usable medium of Claim 20, wherein said instructions in a computer readable form may be downloaded from a website over the Internet.
